BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- ☐ **BLACK BORDERS**
- ☐ **IMAGE CUT OFF AT TOP, BOTTOM OR SIDES**
- ☐ **FADED TEXT OR DRAWING**
- ☐ **BLURRED OR ILLEGIBLE TEXT OR DRAWING**
- ☐ **SKEWED/SLANTED IMAGES**
- ☐ **COLOR OR BLACK AND WHITE PHOTOGRAPHS**
- ☐ **GRAY SCALE DOCUMENTS**
- ☐ **LINES OR MARKS ON ORIGINAL DOCUMENT**
- ☐ **REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY**
- ☐ **OTHER:** _____

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.

1 [Race checking by context inference](#)

Thomas A. Henzinger, Ranjit Jhala, Rupak Majumdar

 June 2004 **ACM SIGPLAN Notices , Proceedings of the ACM SIGPLAN 2004 conference on Programming language design and implementation**, Volume 39 Issue 6

 Full text available: [pdf\(328.94 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Software model checking has been successful for *sequential* programs, where predicate abstraction offers suitable models, and counterexample-guided abstraction refinement permits the automatic inference of models. When checking *concurrent* programs, we need to abstract threads as well as the contexts in which they execute. Stateless context models, such as predicates on global variables, prove insufficient for showing the absence of race conditions in many examples. We therefore use ...

2 [Performance measurements for multithreaded programs](#)

Minwen Ji, Edward W. Felten, Kai Li

 June 1998 **ACM SIGMETRICS Performance Evaluation Review , Proceedings of the 1998 ACM SIGMETRICS joint international conference on Measurement and modeling of computer systems**, Volume 26 Issue 1

 Full text available: [pdf\(1.37 MB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Multithreaded programming is an effective way to exploit concurrency, but it is difficult to debug and tune a highly threaded program. This paper describes a performance tool called Tmon for monitoring, analyzing and tuning the performance of multithreaded programs. The performance tool has two novel features: it uses "thread waiting time" as a measure and constructs thread waiting graphs to show thread dependencies and thus performance bottlenecks, and it identifies "semi-busy-waiting" points w ...

3 [QPATR and constraint threading](#)

James Kilbury

 August 1990 **Proceedings of the 13th conference on Computational linguistics - Volume 3**

 Full text available: [pdf\(330.74 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#)

QPATR is an MS-DOS Arity/PROLOG implementation of the PATR-II formalism for unification grammar. The formalism has been extended to include the constraints of LFG as well as negation and disjunction, which are implemented with the disjunction and negation-as-failure

of PROLOG itself. A technique of *constraint threading* is employed to collect negative and constraining conditions in PROLOG difference lists. The parser of QPATR uses a left-corner algorithm for context-free grammars and inclu ...

1 [Multithreading II: A quantitative framework for automated pre-execution thread selection](#)

Amir Roth, Gurindar S. Sohi

 November 2002 **Proceedings of the 35th annual ACM/IEEE international symposium on Microarchitecture**

 Full text available: [pdf\(2.12 MB\)](#)

 Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)
[Publisher Site](#)

Pre-execution attacks cache misses for which address prediction driven prefetching fails. In pre-execution, copies of cache miss computations are isolated from the main program and launched as separate threads called p-threads whenever the processor anticipates an upcoming miss. P-thread selection is the task of deciding what computations should execute as p-threads and when they should be launched such that total execution time is minimized. It is central to the success of pre-execution. We intr ...

2 [Technical papers: concurrency: Assuring and evolving concurrent programs: annotations and policy](#)

Aaron Greenhouse, William L. Scherlis

 May 2002 **Proceedings of the 24th international conference on Software engineering**

 Full text available: [pdf\(1.38 MB\)](#)

 Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Assuring and evolving concurrent programs requires understanding the concurrency-related design decisions used in their implementation. In Java-style shared-memory programs, these decisions include which state is shared, how access to it is regulated, the roles of threads, and the policy that distinguishes desired concurrency from race conditions. These decisions rarely have purely local manifestations in code. In this paper, we use case studies from production Java code to explore the costs and ...

1 [Isolating failure-inducing thread schedules](#)

Jong-Deok Choi, Andreas Zeller

 July 2002 **ACM SIGSOFT Software Engineering Notes , Proceedings of the 2002 ACM SIGSOFT international symposium on Software testing and analysis**, Volume 27 Issue 4

 Full text available: pdf(488.91 KB) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Consider a multi-threaded application that occasionally fails due to non-determinism. Using the DEJAVU capture/replay tool, it is possible to record the thread schedule and replay the application in a deterministic way. By systematically narrowing down the difference between a thread schedule that makes the program pass and another schedule that makes the program fail, the Delta Debugging approach can pinpoint the error location automatically---namely, the location(s) where a thread switch cause ...

2 [Borrowed-virtual-time \(BVT\) scheduling: supporting latency-sensitive threads in a general-purpose scheduler](#)

Kenneth J. Duda, David R. Cheriton

 April 2000 **ACM SIGOPS Operating Systems Review**, Volume 34 Issue 2

 Additional Information: [full citation](#), [index terms](#)

3 [Borrowed-virtual-time \(BVT\) scheduling: supporting latency-sensitive threads in a general-purpose scheduler](#)

Kenneth J. Duda, David R. Cheriton

 December 1999 **ACM SIGOPS Operating Systems Review , Proceedings of the seventeenth ACM symposium on Operating systems principles**, Volume 33 Issue 5

 Full text available: pdf(1.81 MB) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Systems need to run a larger and more diverse set of applications, from real-time to interactive to batch, on uniprocessor and multiprocessor platforms. However, most schedulers either do not address latency requirements or are specialized to complex real-time paradigms, limiting their applicability to general-purpose systems. In this paper, we present *Borrowed-Virtual-Time (BVT) Scheduling*, showing that it provides low-latency for real-time and interactive applications yet weighted sharin ...

This paper describes a method to improve the cache locality of sequential programs by scheduling fine-grained threads. The algorithm relies upon hints provided at the time of thread creation to determine a thread execution order likely to reduce cache misses. This technique may be particularly valuable when compiler-directed tiling is not feasible. Experiments with several application programs, on two systems with different cache structures, show that our thread scheduling method can improve pro ...

11 Hardware Scheduling for Dynamic Adaptability using External Profiling and Hardware Threading

Brian Swahn, Soha Hassoun

November 2003 **Proceedings of the 2003 International Conference on Computer-Aided Design (ICCAD'03) - Volume 00**

Full text available:  [Publisher Site](#) Additional Information: [full citation](#), [abstract](#)

While performance, area, and power constraints have been the driving force in designing current communication-enabled embedded systems, post-fabrication and run-time adaptability is now required. Two dominant configurable hardware platforms are processors and FPGAs. However, for compute-intensive applications, neither platform delivers the needed performance at the desired low power. The need thus arises for custom, application-specific configurable (ASC) hardware. This paper addresses the optimization ...
